

# Why are updates so important?

- new features
- fixies for critical issues
- optimizations

Only after updates our build time decreased by 3 times.

Main bundle decreased by 20% in size.

Without any optimizations, refactoring, additional plugins.

## custom-typings.d.ts after updates

Only 7 modules are left, BUT for 3 of them there are @types modules.

Be carefull with this! The fact that @types exists, doesn't always mean that it is good enough.

@types/react-dnd — a lot of issues with decorators syntax.

@types/victory — good typings, but not full. Not all components are included.

BUT we're developers and we should find a way how to use 3-rd party dependencies as much as possible :)
